

What will we learning in this Lesson?

- How to use images
- How to make more advanced web pages

Images on websites:

To display an image on a website we use the `` tag.

The `` tag is different from the other tags we've used before as it doesn't have a closing tag.

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <title>New Web Page</title>
5   </head>
6   <body>
7     <img src="">
8   </body>
9 </html>
```

The `src=""` part of the image tag tells the computer where the image is. This way the computer can load the image onto the screen. **It's very important that the image is in the same folder as the website files, or else it won't load.** Now, get an image from google images and save it to the USB. We recommend you rename the image to something like img or download.

N.B. If you get stuck here ask a teacher for help!

Loading in the images:

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <title>New Web Page</title>
5   </head>
6   <body>
7     
8   </body>
9 </html>
```

Now we need to put the name of our image (I called mine 'img') and the file extension (this one is a .png file) inside the src quotes e.g.

`src="img.png"`

Task:

Add some images to your personal web page.

Bonus task:

Find out what each of these HTML tags do. You can use the <https://www.w3schools.com/> website to learn more or ask a teacher if you get stuck.

- `
`
- `<hr>`
- ``
- ``
- ``
